

ProtoECO

ProtoECO is a computational (*in silico*) tool focused on the prediction of endpoints related with ecotoxicity and the environmental effects chemical substances. This includes properties related to the distribution and degradation of substances in the environment as well as their toxic effects in the biota.

ProtoECO mainly includes, but is not limited to, endpoints used by REACH, a European Union regulation, adopted to improve the protection of human health and the environment from the risks that can be posed by chemicals, while enhancing the competitiveness of the EU chemicals industry.

Endpoint

Environmental fate parameters: Persistence: Biodegradation. Ready/not ready biodegradability.

Biodegradation is a naturally occurring process where microorganisms, such as bacteria, feed themselves by breaking-down (organic) substances into smaller fragments which may themselves be further degraded to even smaller fragments. When 'complete' biodegradation takes place, all that will be left of the substance is water, carbon dioxide and salts.

Metrics

Training set

Experimental values

QSAR predictions

	not ready biodegradable	ready biodegradable
not ready biodegradable	565	28
ready biodegradable	25	229

Parameters	Training	Validation
Accuracy	0.94	0.83
Sensitivity / recall	0.90	0.62
Specificity	0.95	0.92
Precision	0.89	0.77
Negative predictive value	0.96	0.85
F-score	0.90	0.69
Matthews Correlation Coefficient	0.85	0.58
Critical Success Index	0.81	0.53
Area under the ROC	0.93	0.77

Validation set

Experimental values

QSAR predictions

	not ready biodegradable	ready biodegradable
not ready biodegradable	236	20
ready biodegradable	41	68

ProtoECO is part of

ProtoPRED platform allows the easy, fast and user-friendly prediction of different properties of chemical compounds, by proprietary (Q)SAR models.
